## 2015 WHEAT CROP REVIEW

### Weather and Crop Development

The 2014-2015 wheat crop enjoyed a productive start in the fall for most of the state with adequate moisture and mild temperatures. Planting for some areas of Kansas was delayed a few weeks by rain, but overall the wheat experienced very good emergence and establishment.

This would take a turn in November, however, when the crop was forced to contend with a roller coaster of fluctuating temperatures. The most extreme fluctuation was a 75°F-drop in temperature in 24 hours in western Kansas, but most areas of the state had some level of winter injury. Winterkill, combined with an early spring drought, resulted in many acres of stressed wheat.

Relief of sorts came in late spring, when precipitation greatly picked up across the state. However, with the increased rainfall came an explosion of wheat diseases that further impacted the yield and grain quality of the stressed crop. Test weights of varieties susceptible to foliar diseases and head scab were significantly diminished to the point that some producers could not find an outlet to sell their wheat. Resistant varieties that had survived the winter with minimal damage tended to yield much better, but still reported reduced test weight and grain quality. At the time of harvest, 67% of the 2015 wheat crop was rated as fair to very poor. (*Crop Progress and Conditions* report, Kansas Agricultural Statistics)

### Diseases

Diseases were a major production factor in 2015. The cool temperatures, frequent rainfall and extended periods of high relative humidity favored the development of multiple fungal diseases. Stripe rust was the most important disease this year and was severe in all regions of the state. Statewide, stripe rust caused more than 10% yield loss, and losses exceeding 20% were common in individual fields. The yield of wheat varieties with resistance to stripe rust was above-average at most locations.

Fusarium head blight (head scab) was an issue for many wheat growers in eastern Kansas where disease incidence often exceeded 40% in susceptible varieties. Leaf rust also reappeared this season with a flush of disease late in the growing season. Fortunately, this leaf rust was late enough that it did not cause significant yield loss relative to other diseases this year.

Wheat streak mosaic remerged as a serious problem in western Kansas this year. In most cases, fields with severe wheat streak mosaic were associated with poor control of volunteer wheat the previous summer. Mild temperatures last fall likely aided the spread of this viral disease beyond fields directly adjacent to those with volunteer wheat. Overall, the 2015 growing season will be ranked among the most severe disease years on record in Kansas. (Erick De Wolf, Kansas State University Plant Pathologist)

### Insects

No seed or seedling pest problems were reported early in the fall. By mid to late October, grasshoppers were moving into the growing wheat fields and causing concern for many growers. Grasshoppers don't usually cause any impact on growing wheat, as was the case in the fall of 2014. Populations were soon eliminated by the first freeze. One additional fall insect problem was an abundance of armyworms moving from sorghum into the growing wheat, especially in southcentral and northcentral Kansas. Armyworms don't overwinter in Kansas wheat, but army cutworms do and there were many reports of army cutworm feeding in early spring.

Hessian flies also continue to cause problems. Several fields across the state, all south of Interstate 70, were severely infested with Hessian fly, to the point that most were plowed under in early spring. Some plants not plowed under did produce tillers but considerable thinning had already occurred. This, followed by serious lodging just prior to harvest, rendered yields negligible. Also, there was considerable concern relative to aphids (both greenbugs and bird cherry-oat) as the wheat was heading. Many beneficials (both lady beetles and parasitic wasps) were noted however, and insecticide applications were not warranted over most of Kansas, especially at this late wheat growth stage. (Jeff Whitworth, Kansas State University Extension Entomologist)

### Harvest Statistics

The Kansas Agricultural Statistics July 10 estimate of the 2015 crop was 334 million bushels from 8.8 million acres, up 36% from last year's crop. Yield per harvested acre is expected to average 38 bushels, up 10 bushels from last year's final yield. (July 10, 2015, *Crops Report*, Kansas Agricultural Statistics)

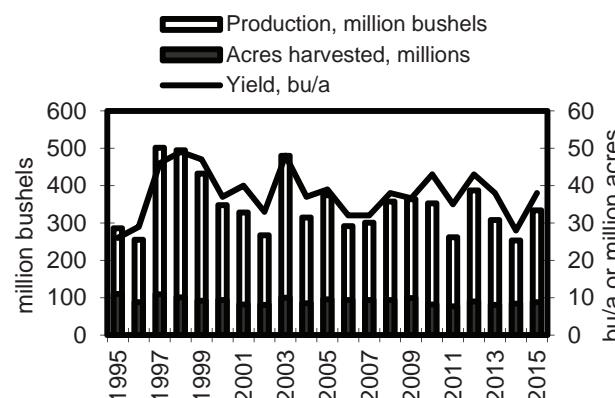

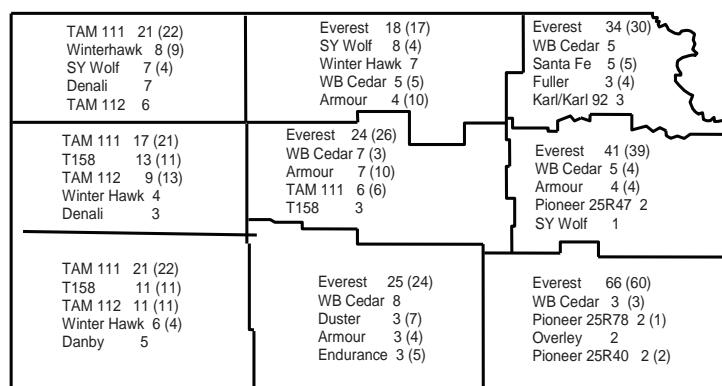

Figure 1. Historical Kansas wheat production

Everest remained the leading variety of wheat seeded in Kansas. It accounted for 15.8% of the state's wheat and was the most popular variety in the eastern two-thirds of the state. TAM 111 remained at second with 9.1% of acreage and is the leading variety in the western third of the state. T158 remained in third place, accounting for 5.1% of wheat acres; WB Cedar jumped to fourth place with 4.9%; and TAM 112 dropped one place to fifth with 4.0% of wheat acres. (February 2015, *Wheat Variety*, Kansas Agricultural Statistics)

#### Acreage Distribution

**Figure 2. Leading wheat varieties in Kansas; percentage of seeded acreage for 2015 and (2014) crops**

## 2015 PERFORMANCE TESTS

The Kansas Agricultural Experiment Station annually compares both new and currently grown varieties in the state's major crop-producing areas. These performance tests generate unbiased performance information designed to help Kansas growers select wheat varieties suited for their area and conditions.

Site descriptions and management practices for each site are summarized in Table 3. One-year or one-location results can be misleading because of the possibility of unusual weather or pest conditions.

#### Environmental Factors

Winterkill and disease were determining factors in most of the tests in the 2014-2015 growing season. **Be sure to keep extenuating environmental conditions in mind when examining test results.** Results from the dryland tests at Colby and Garden are not reported due to crop failure because of winter injury and heavy disease pressure. The soft wheat test at Parsons was not reported due to a planting error that led to unacceptable variability. For more information on winter survival ratings, please visit: <http://agronomy.ksu.edu/services/crop-performance-tests/index.html>.

## Varieties

Public varieties are selected for inclusion in the tests on the basis of several criteria. Most represent new or established varieties from Georgia, Nebraska, Oklahoma, Texas, and Colorado with potential for successful use in Kansas. Some are included as long-term checks. Others are entered at the request of the originating institution.

Originators or marketers enter privately developed varieties voluntarily. Entrants choose both the entries and test sites. The 2015 private entrants are listed in Table 1. Eleven private entrants provided a total of 40 varieties for testing.

## Results and Variety Characterization

Results from Kansas tests are presented in Tables 4 through 11. Yields are reported as bushels per acre (60 lb/bu) and are adjusted to a moisture content of 13% where moistures were reported at harvest. Yields also are converted to percentages of the test average to speed recognition of the highest-yielding entries. Multi-year averages are presented for those varieties entered more than 1 year.

Additional information such as test weight, heading date, and plant height is helpful for fine-tuning variety comparisons. Planting varieties with a range of maturities helps minimize weather risks.

At the bottom of each table is the (0.05) LSD (least significant difference) for each column of replicated data. One can think of the LSD as a "margin of error" that shows how big the difference between two varieties must be for one to be 95% confident that the difference is real. The use of the LSD is intended to reduce the chance of overemphasizing small differences. Small variations in soil structure, fertility, water-holding characteristics, and other test-site characteristics can cause considerable yield variation among plots of one variety.

## Electronic Access

To access crop performance testing information electronically, visit the website at:  
<http://agronomy.ksu.edu/services/crop-performance-tests/index.html>

## Research and Duplication Policy

When companies submit entries, permission is given to Kansas State University to test varieties and/or hybrids designated on the entry forms in the manner indicated in the test announcements. Seed submitted for testing should be a true sample of the seed being offered for sale.

All results from Kansas Crop Performance Tests belong to the University and the public and shall be controlled by the University to produce the greatest benefit to the public. Performance data may be used in the following ways: 1) Tables may be reproduced in their entirety, provided the

source is referenced and data are not manipulated or reinterpreted; and 2) advertising statements by an individual company about the performance of its entries may be made as long as they are accurate statements about the data as published, with no reference to other companies' names or cultivars. In both cases, the following must be included with the reprint or ad citing the appropriate publication number and title: "See the official Kansas State University Agricultural Experiment Station and Cooperative Extension Service Report of Progress 1119 '2015 Kansas Performance Tests with Winter Wheat Varieties,' or the Kansas Crop Performance Test website, <http://www.agronomy.ksu.edu/services/crop-performance-tests> for details. Endorsement or recommendation by Kansas State University is not implied."

Brand names appearing in this publication are for product identification purposes only. No endorsement is intended, nor is criticism implied of similar products not mentioned.

+Hard white variety

Scale: 1=Best  
9=Poor

1=Short  
9=Long

1=Early  
9=Late

1=Best  
9=Poorest

1=Tolerant  
9=Susceptible

1=Least resistant/tolerant

1=Exceptional; large kernels; high protein content; very good milling, mixing, and commercial bread-baking.

AC = Acceptable; milling and baking attributes acceptable, but not outstanding, for all properties; may have minor defects.

LD = Less Desirable; one or more serious quality defects.

SD = Inadequate information or conflicting data.

TD = Tolerant; needed for blending with weaker wheats; may not be suitable alone for bread flour.

\*Strong blending wheat; available commercial varieties.

\*\*New Russian wheat aphid biotype is thought to be virulent on all currently available commercial varieties.

1 Varieties and percentage seeded acreage from the Feb. 2015, wheat variety survey, Kansas Agricultural Statistics, Topeka, KS.

2 Most ratings are estimates based on information and observations from many sources over several years. Agronomic information by Jim Shroyer and Steve Watson - K-State Agronomy.

3 Summary of crop performance test results from recent years.

4 Ratings from Rebecca Miller - K-State Wheat Quality Laboratory.

5 Ratings by Allan Fritz - Manhattan, Guorong Zhang - Hays, Erick DeWolf and Bill Bockus - K-State Plant Pathology

Final ratings and descriptions of disease and insect pests are available in "Wheat Variety Disease and Insect Ratings 2015," Publication MF991 from Kansas State University.

**Table 3. Wheat performance test site descriptions and management in 2015**

<b>Region and location</b>	<b>Soil type previous crop</b>	<b>N</b>	<b>P<sub>2</sub>O<sub>5</sub></b>	<b>K<sub>2</sub>O</b>	<b>Plant-harvest seed rate</b>	<b>Conditions</b>
<b><u>Northeast Dryland</u></b>						
Ashland Agronomy Farm Manhattan (MA)	Reading silt loam Soybean	70	0	0	Fall 75 lb/a	Leaf rust was present later in the season. Freeze injury was an issue for some varieties.
<b><u>Southeast Dryland</u></b>						
East Central KS Experiment Field Ottawa (OT)	Woodson silt loam Soybean	94	40	13	Fall 60 lb/a	Good moisture throughout growing season, which expedited infections of leaf rust and head scab.
Southeast Agricultural Research Center Parsons (PA)	Parsons silt loam Corn	100	0	20	Fall 90 lb/a	Good establishment in the fall; mild winter with little snow cover followed by a very wet spring and cool, wet summer.
<b><u>Soft Wheat</u></b>						
Southeast Agricultural Research Center Parsons (PA)	Parsons silt loam Corn	100	0	20	Fall 90 lb/a	Planting error led to extreme variability; test is not reported.
<b><u>North Central Dryland</u></b>						
North Central KS Experiment Field Belleville (BE)	Crete silt loam Fallow	80	30	0	Fall 90 lb/a	Stands were reduced by winterkill for many varieties and further affected by low temperatures in April and May.
North Central KS Farmer's Field Beloit (BL)	Harney silt loam Wheat	90	25	0	Fall 80 lb/a	Stands were reduced by winterkill for many varieties and further affected by low temperatures in April and May.
<b><u>Central Dryland</u></b>						
Central KS Farmer's Field Gypsum (GY)	Silty clay loam Fallow	50	0	0	Fall 90 lb/a	Stripe rust and leaf rust were prevalent.
Central KS Farmer's Field Lorraine (LR)	McCook silt loam Fallow	60	0	0	Fall 60 lb/a	Stripe rust and leaf rust were prevalent.
<b><u>South Central Dryland</u></b>						
South Central KS Farmer's Field McPherson (MC)	Crete silt loam Fallow	60	0	0	Fall 60 lb/a	Favorable conditions throughout growing season; some leaf rust late in the season.
South Central KS Experiment Field Hutchinson (HU)	Funmar-Taver loam Canola	116	0	0	Fall 75 lb/a	Fluctuating temperatures in the fall and winter impacted plant stands; severe leaf and stripe rust infections in the spring.
South Central KS Farmer's Field Conway Springs (CW)	Sandy loam Fallow	40	0	0	Fall 60 lb/a	Stripe rust and leaf rust were prevalent.
<b><u>Northwest Dryland</u></b>						
Agricultural Research Center Hays (HA)	Harney silt loam Wheat	80	0	0	Fall 60 lb/a	Dry conditions and low temperatures caused winter injury. Early spring drought was relieved by precipitation later in the season.
Northwest Research-Extension Center Colby (CO)	Keith silt loam Fallow	60	20	0	Fall 60 lb/a	Severe infections of wheat streak mosaic, leaf rust, and stripe rust caused extreme variability. Test is not reported.
Northwest Research-Extension Center Tribune (TR)	Richfield silt loam Fallow	65	25	0	Fall 55 lb/a	Rapid drop in temperature in the fall and dry conditions caused winterkill in some varieties.
Northwest KS Farmer's Field Wakeeny (WA)	Harney clay loam Grain Sorghum	40	0	0	Fall 50 lb/a	Winter injury to some varieties. The test was sprayed with a fungicide around heading time.
<b><u>Southwest Dryland</u></b>						
Southwest KS Farmer's Field Larned (LA)	Harney clay loam Grain sorghum	75	0	0	Fall 50 lb/a	Winter injury to some varieties. The test was sprayed with a fungicide around heading time.
Southwest KS Farmer's Field Dodge City (DC)	Harney clay loam Grain Sorghum	60	0	0	Fall 45 lb/a	Early drought stress in the spring. Stripe rust was present.
Southwest Research-Extension Center Garden City (GC)	Keith silt loam Wheat	60	0	0	Fall 65 lb/a	Winter injury followed by dry conditions in the early spring. Test was abandoned.
<b><u>Western Irrigated</u></b>						
Northwest Research-Extension Center Colby (CO)	Keith silt loam Fallow	110	20	0	Fall 90 lb/a	Stripe rust and leaf rust were prevalent; winterkill was an issue with many varieties.
Southwest Research-Extension Center Garden City (GC)	Keith silt loam Corn	100	0	0	Fall 75 lb/a	Winter injury to some varieties. Stripe rust and wheat streak mosaic were present.
Western KS Farmer's Field Healy, Lane County (LN)	Scott silt loam Fallow	90	0	0	Fall 80 lb/a	Dry, early spring conditions were relieved by later precipitation. Less winter injury than in other western tests.
